Abstract:

We investigate the singularity formation of a 3D model that was recently proposed by Hou and Lei in [1] for axisymmetric 3D incompressible Navier-Stokes equations with swirl. The main difference between the 3D model of Hou and Lei and the reformulated 3D Navier-Stokes equations is that the convection term is neglected in the 3D model. This model shares many properties of the 3D incompressible Navier-Stokes equations. One of the main results of this paper is that we prove rigorously the finite time singularity formation of the 3D model for a class of initial boundary value problems with smooth initial data of finite energy. We also prove the global regularity for a class of smooth initial data.
